

Assignment 3 has introduced me to 3 new technologies strapi, docker and GitHub, the assignment allowed me to gain hand on experience with these technologies. Strapi was convenient in creating the API for my frontend application and their documentation was clear to understand making it easier to work with. Docker was interesting to work with the theory of creating a container from images to allow applications to run on device was appealing. However, I did have difficulties working with creating the container and running was not a problem the issue came in when trying to create a compose so my backend can be connected to my frontend I had difficulties getting my front to communicate with my frontend in the docker container I have been trouble shooting different ideas to attempt on making it work yet with no success the frontend runs as intended however the backend does not. Using git was interesting. Git allowed me to track changes I have made to the files with great ease. However, I have through my process of completing the assignment I have never needed to go back to previous versions of the repository I would backtrack manually or manually update the files to their previous versions when needed this is mainly due to the fact I am more comfortable doing it that way. Another issue I came across using git was attempting to upload my file to a remote repo which is GitHub I was unable to make the connection successfully, so I attempted to upload the files manually, but the limit did make it challenging to do so.
